Figure 1. A schematic diagram of the experimental design. The subjects were divided into two groups: the control group and the experimental group. The control group received a standard curriculum, while the experimental group received a curriculum that included a module on the effects of alcohol on the brain. The experimental group was further divided into two subgroups: the high-risk group and the low-risk group. The high-risk group was defined as those subjects who had a family history of alcoholism, while the low-risk group was defined as those subjects who did not have a family history of alcoholism. The subjects in the high-risk group were further divided into two subgroups: the high-risk/high-SES group and the high-risk/low-SES group. The subjects in the low-risk group were further divided into two subgroups: the low-risk/high-SES group and the low-risk/low-SES group. The subjects in the high-risk/high-SES group and the low-risk/high-SES group received a standard curriculum, while the subjects in the high-risk/low-SES group and the low-risk/low-SES group received a curriculum that included a module on the effects of alcohol on the brain. The subjects in the high-risk/low-SES group and the low-risk/low-SES group were further divided into two subgroups: the high-risk/low-SES/high-SES group and the low-risk/low-SES/high-SES group. The subjects in the high-risk/low-SES/high-SES group and the low-risk/low-SES/high-SES group received a standard curriculum, while the subjects in the high-risk/low-SES/low-SES group and the low-risk/low-SES/low-SES group received a curriculum that included a module on the effects of alcohol on the brain.
